LAB EXERCISE 5- UNDERSTANDING CMD, RUN, AND ENTRYPOINT IN DOCKERFILE

OBJECTIVE:

TO LEARN THE DIFFERENCES BETWEEN CMD, RUN, AND ENTRYPOINT INSTRUCTIONS IN DOCKERFILES BY CREATING AND RUNNING DOCKER CONTAINERS WITH DIFFERENT CONFIGURATIONS.

PREREQUISITES:

- **DOCKER INSTALLED ON YOUR MACHINE**
 - **BASIC UNDERSTANDING OF DOCKER AND DOCKERFILE**
-

PART 1: OVERVIEW OF CMD, RUN, AND ENTRYPOINT

- **RUN:** EXECUTES COMMANDS AT BUILD TIME TO INSTALL SOFTWARE, DOWNLOAD DEPENDENCIES, OR CONFIGURE THE ENVIRONMENT. THE RESULT IS SAVED IN THE IMAGE.
 - **CMD:** SPECIFIES THE DEFAULT COMMAND TO BE EXECUTED WHEN A CONTAINER STARTS. IT CAN BE OVERRIDDEN WHEN RUNNING A CONTAINER.
 - **ENTRYPOINT:** DEFINES THE MAIN EXECUTABLE FOR THE CONTAINER, WHICH CAN'T BE EASILY OVERRIDDEN. HOWEVER, ADDITIONAL ARGUMENTS CAN BE PASSED WHEN THE CONTAINER STARTS.
-

PART 2: EXPLORING RUN COMMAND

1. **CREATE A DOCKERFILE WITH RUN:**

CREATE A DIRECTORY CALLED DOCKERFILE-RUN-CMD-ENTRYPOINT AND NAVIGATE TO IT:

```
mkdir dockerfile-run-cmd-entrypoint && cd dockerfile-run-cmd-entrypoint
```

CREATE A SIMPLE DOCKERFILE THAT USES THE RUN INSTRUCTION:

```
# Use an official Ubuntu base image
FROM ubuntu:20.04

# Update the package repository and install curl
RUN apt-get update && apt-get install -y curl

# Print the version of curl
RUN curl --version
```

2. **BUILD THE DOCKER IMAGE:**

BUILD THE IMAGE USING THE DOCKERFILE:

```
docker build -t run-example .
```

3. EXPLANATION:

THE RUN COMMANDS IN THIS DOCKERFILE ARE EXECUTED DURING THE IMAGE BUILD PROCESS. THE FIRST RUN INSTALLS CURL, AND THE SECOND RUN COMMAND CHECKS AND PRINTS THE CURL VERSION. AFTER THE IMAGE IS BUILT, THE COMMANDS EXECUTED BY RUN ARE ALREADY BAKED INTO THE IMAGE.

4. VERIFY WITH DOCKER HISTORY:

YOU CAN CHECK THE LAYERS CREATED BY RUN USING:

docker history run-example

EACH RUN COMMAND CREATES A NEW LAYER IN THE IMAGE.

IMAGE	CREATED	CREATED BY	SIZE	COMMENT
2217016c8aa4	23 seconds ago	RUN /bin/sh -c curl --version # buildkit	4.1kB	buildkit.dockerfile.v0
<missing>	23 seconds ago	RUN /bin/sh -c apt-get update & apt-get ins...	55MB	buildkit.dockerfile.v0
<missing>	9 months ago	/bin/sh -c #(nop) CMD ["/bin/bash"]	0B	
<missing>	9 months ago	/bin/sh -c #(nop) ADD file:2c90d89e4dd4e1d24...	74.6MB	
<missing>	9 months ago	/bin/sh -c #(nop) LABEL org.opencontainers....	0B	
<missing>	9 months ago	/bin/sh -c #(nop) LABEL org.opencontainers....	0B	
<missing>	9 months ago	/bin/sh -c #(nop) ARG LAUNCHPAD_BUILD_ARCH	0B	
<missing>	9 months ago	/bin/sh -c #(nop) ARG RELEASE	0B	

PART 3: EXPLORING CMD COMMANDS

1. CREATE A DOCKERFILE WITH CMD:

MODIFY THE DOCKERFILE TO INCLUDE THE CMD INSTRUCTION:

```
# Use an official Ubuntu base image
FROM ubuntu:20.04

# Install curl
RUN apt-get update && apt-get install -y curl

# Set default command to display the curl version
```

```
# Use an official Ubuntu base image
FROM ubuntu:20.04

# Install curl
RUN apt-get update && apt-get install -y curl

# Set default command to display the curl version
CMD ["curl", "--version"]
```

2. BUILD THE DOCKER IMAGE:

BUILD THE DOCKER IMAGE AGAIN:

```
docker build -t cmd-example .
```

3. RUN THE CONTAINER:

RUN THE CONTAINER AND SEE THE OUTPUT:

```
docker run cmd-example
```

THE OUTPUT WILL DISPLAY THE CURL VERSION AS THE DEFAULT COMMAND DEFINED BY CMD IS EXECUTED WHEN THE CONTAINER STARTS.

```
curl 7.68.0 (aarch64-unknown-linux-gnu) libcurl/7.68.0 OpenSSL/1.1.1f zlib/1.2.11 brotli/1.0.7 libidn2/2.2.0 libpsl/0.21.0 (+libidn2/2.2.0) libssh/0.9.3/openssl/zlib nghttp2/1.40.0 librtmp/2.3
Release-Date: 2020-01-08
Protocols: dict file ftp ftps gopher http https imap imaps ldap ldaps pop3 pop3s rtmp rtsp scp sftp smb smbs smtp smtps telnet tftp
Features: AsynchDNS brotli GSS-API HTTP2 HTTPS-proxy IDN IPv6 Kerberos Largefile libz NTLM NTLM_WB PSL SPNEGO SSL TLS-SRP UnixSockets
```

4. OVERRIDE CMD:

YOU CAN OVERRIDE THE CMD BY SPECIFYING A DIFFERENT COMMAND WHEN YOU RUN THE CONTAINER:

```
docker run cmd-example echo "Hello from CMD!"
```

THIS WILL PRINT HELLO FROM CMD!, SHOWING THAT THE CMD CAN BE OVERRIDDEN AT RUNTIME.

PART 4: EXPLORING ENTRYPOINT COMMAND

1. CREATE A DOCKERFILE WITH ENTRYPOINT:

MODIFY THE DOCKERFILE TO USE ENTRYPOINT INSTEAD OF CMD:

```
# Use an official Ubuntu base image
FROM ubuntu:20.04

# Install curl
RUN apt-get update && apt-get install -y curl
```

```
# Set entrypoint to curl command
```

ENTRYPOINT ["curl"]

```
# Use an official Ubuntu base image
FROM ubuntu:20.04

# Install curl
RUN apt-get update && apt-get install -y curl

# Set entrypoint to curl command
ENTRYPOINT ["curl"]
```

2. BUILD THE DOCKER IMAGE:

BUILD THE IMAGE WITH THE ENTRYPPOINT INSTRUCTION:

```
docker build -t entrypoint-example .
```

3 RUN THE CONTAINER:

WHEN YOU RUN THE CONTAINER, SINCE ENTRYPPOINT IS SET TO CURL, YOU NEED TO

PROVIDE ARGUMENTS TO THE CURL COMMAND:

```
docker run entrypoint-example --version
```

THIS WILL PRINT THE CURL VERSION BECAUSE ENTRYPOINT DEFINES THE MAIN EXECUTABLE (IN THIS CASE, CURL) AND --VERSION IS PASSED AS AN ARGUMENT TO CURL.

```
curl 7.68.0 (arch64-unknown-linux-gnu) libcurl/7.68.0 OpenSSL/1.1.1f zlib/1.2.11 brotli/1.0.7 libidn2/2.2.0 libpsl/0.21.0 (+libidn2/2.2.0) libssh/0.9.3/openssl/zlib nghttp2/1.40.0 librtmp/2.3
Release-Date: 2020-01-08
Protocols: dict file ftp ftps gopher http https imap imaps ldap ldaps pop3 pop3s rtmp rtmps sftp scp smb smb3 smbts smtps telnet tftp
Features: AsynchDNS GSS-API HTTP2 HTTPS-proxy IDN IPv6 Kerberos Largefile libz NTLM NTLM_WB PSL SPNEGO SSL TLS SRP UnixSockets
```

4. OVERRIDE ENTRYPOINT:

UNLIKE CMD, THE ENTRYPPOINT IS NOT EASILY OVERRIDDEN. IF YOU TRY TO OVERRIDE IT USING:

```
docker run entrypoint-example echo "Hello from ENTRYPPOINT!"
```

IT WILL RESULT IN AN ERROR BECAUSE CURL WILL INTERPRET ECHO AS AN ARGUMENT.

HOWEVER, YOU CAN USE THE --ENTRYPOINT OPTION TO CHANGE THE ENTRYPPOINT:

```
docker run --entrypoint /bin/bash entrypoint-example -c "echo Hello from ENTRYPPOINT!"
```

THIS RUNS THE CONTAINER WITH /BIN/BASH AS THE ENTRYPPOINT, OVERRIDING THE DEFAULT ENTRYPPOINT.

```
% Total    % Received % Xferd  Average Speed   Time   Time   Time  Current
          Dload  Upload   Total Spent   Left  Speed
0       0       0       0       0       0      0 --:--:-- --:--:-- 0curl: (6) Could not resolve host: echo
curl: (3) URL using bad/illegal format or missing URL
```

PART 5: COMBINING CMD AND ENTRYPPOINT

1. CREATE A DOCKERFILE WITH BOTH CMD AND ENTRYPPOINT:

MODIFY THE DOCKERFILE TO USE BOTH CMD AND ENTRYPPOINT:

```
# Use an official Ubuntu base image
FROM ubuntu:20.04

# Install curl
RUN apt-get update && apt-get install -y curl

# Set entrypoint to curl
ENTRYPOINT ["curl"]

# Set default arguments to --version
```

```
# Use an official Ubuntu base image
FROM ubuntu:20.04

# Install curl
RUN apt-get update && apt-get install -y curl

# Set entrypoint to curl
ENTRYPOINT ["curl"]

# Set default arguments to --version
CMD ["--version"]
```

2 BUILD THE IMAGE:

BUILD THE NEW IMAGE:

```
docker build -t combined-example .
```

3. RUN THE CONTAINER:

WHEN YOU RUN THE CONTAINER WITHOUT SPECIFYING ANY ARGUMENTS, IT WILL USE THE CMD AS ARGUMENTS TO ENTRYPOINT:

```
docker run combined-example
```

THE OUTPUT WILL SHOW THE CURL VERSION, AS ENTRYPOINT IS CURL AND CMD PROVIDES --VERSION AS THE ARGUMENT.

4. OVERRIDE CMD ARGUMENTS:

YOU CAN OVERRIDE THE CMD ARGUMENTS BY SPECIFYING YOUR OWN ARGUMENTS:

```
docker run combined-example https://www.google.com
```

THIS COMMAND WILL RUN CURL [HTTPS://WWW.GOOGLE.COM](https://www.google.com) INSIDE THE CONTAINER.

SUMMARY OF DIFFERENCES:

- **RUN:** EXECUTES COMMANDS DURING THE IMAGE BUILD PROCESS AND CREATES LAYERS. IT IS USED TO INSTALL PACKAGES AND CONFIGURE THE ENVIRONMENT.
 - **CMD:** SPECIFIES THE DEFAULT COMMAND TO RUN WHEN THE CONTAINER STARTS. IT CAN BE OVERRIDDEN BY PASSING A DIFFERENT COMMAND WHEN RUNNING THE CONTAINER.
 - **ENTRYPOINT:** SPECIFIES THE MAIN COMMAND FOR THE CONTAINER. IT IS HARDER TO OVERRIDE BUT ALLOWS PASSING ARGUMENTS FROM THE COMMAND LINE. WHEN COMBINED WITH CMD, CMD PROVIDES THE DEFAULT ARGUMENTS FOR ENTRYPOINT.

CONCLUSION:

THIS LAB EXERCISE DEMONSTRATES THE FUNDAMENTAL DIFFERENCES BETWEEN `RUN`, `CMD`, AND `ENTRYPOINT` IN DOCKER. EACH COMMAND SERVES A DIFFERENT PURPOSE, FROM IMAGE BUILD-TIME

CONFIGURATION (`RUN`) TO DEFINING THE CONTAINER'S BEHAVIOR AT RUNTIME (`CMD` AND `ENTRYPOINT`).

UNDERSTANDING THESE DIFFERENCES IS CRUCIAL FOR BUILDING EFFECTIVE AND FLEXIBLE DOCKER IMAGES.
